

Evidence map: what is supported, blocked or unresolved

Evidence question	Record-level status	Inference ceiling
Connectome structure → task computation	Bounded M0 result; Fish1.5 directional association not supported; topology null indeterminate	Frozen assay / one specimen
Biological computation in source system	Published worm evidence; animal-level project reanalysis blocked by schema	Published cell-class scope
Cross-system substrate resolution	R20-01 supports projection-level evidence only	Mechanism unresolved
Direct realized-state input → artificial utility	M2: no AcRKN advantage; generic references had lower MSE	One synthetic plant/task
Preserved temporal information → artificial utility	M5: local-rule correspondence effect; generic ridge and replay effects were larger	One synthetic generator/task
General transfer requirement or law	Not established by either portfolio	Retrospective evidence proposal

M2 and M5 have different endpoints and independent units; no cross-task effect is calculated. The ordering is an editorial evidence map, not a validated hierarchy, scale or causal chain.
